

## PRESS RELEASE

13 April 2023 | FOR IMMEDIATE RELEASE

### **NUS researchers report potential new treatment for leaky gut using milk-derived extracellular vesicles**

*Milk-derived extracellular vesicles (mEVs), a type of natural nanoparticles present in bovine and human breast milk, are reported to restore gut barrier integrity, prevent leakage of bacterial toxins into the blood stream, and alleviate gut and liver disorders.*

Singapore, 13 April 2023 — The intestinal or gut barrier is crucial for nutrient absorption and preventing harmful substances from leaking into the blood stream. Under diseased conditions, the disruption of the gut barrier may increase its permeability and result in a "leaky gut".

The "leaky gut" syndrome often comes with symptoms like chronic diarrhea, constipation, or bloating. It has been associated with many diseases, including inflammatory bowel disease and non-alcoholic fatty liver disease.

Both diseases are highly prevalent in the general population, with the latter affecting around 40% of the Singaporean population, while inflammatory bowel disease affects 1-3 in 10,000 Singaporeans. However, treatment options for these two highly common diseases are limited. Repairing the leaky gut is thus a potential strategy for the treatment of these diseases.

At the same time, milk, as nature's first functional food, plays essential roles in the development of the intestinal barrier and gut immune system. Both human and bovine milk are rich in extracellular vesicles (mEVs), which are nanosized particles containing beneficial components that can improve gut immunity and quality of gut bacteria.

However, it is unclear whether mEVs protect the gut barrier and treat the leaky gut.

To this end, Assistant Professor Jiong-Wei Wang from the Nanomedicine Translational Research Programme and Centre for NanoMedicine at the Yong Loo Lin School of Medicine, National University of Singapore (NUS Medicine), in collaboration with Professor Huaxi Yi from Ocean University of China, led a research team to investigate the potential treatment effects of mEVs on the leaky gut. This study is published in [Science Advances](#).

The mEVs are obtained by removing milk fat, proteins and lactose with an in-house approach developed by Asst Prof Wang and his team. They discovered that large amounts of proteins and small nucleic acids carried in mEVs are associated with gut barrier function. The mEVs extracted from both human breast milk and cow milk carry similar therapeutic contents. The treatment efficacy of mEVs was demonstrated in laboratory models.

After orally administering mEVs to the models, the researchers observed that their intestinal inflammation was suppressed, and the damaged gut barrier was repaired. More importantly, the mEVs prevented the leakage of gut bacterial toxins into the blood stream, effectively averting toxin-induced liver damage.

This illustrates that oral administration of mEVs can potentially heal the leaky gut, and effectively slow down the progression of inflammatory bowel disease and nonalcoholic fatty liver disease.

“A leaky gut is a common effect of many diseases. However, whether the leaky gut is a symptom, or a cause of those diseases, remains debatable. Our research shows that treating the leaky gut with mEVs can ameliorate both inflammatory bowel disease and nonalcoholic fatty liver disease, two types of diseases that are seemingly unrelated,” said Asst Prof Wang, the lead author of this study.

“Another interesting finding is that mEVs extracted from milk produced at different stages after pregnancy—colostrum, transient or mature milk, all exert similar gut barrier protection,” Asst Prof Wang added.

Colostrum milk refers to the milk initially produced by the breast during pregnancy, while transitional milk refers to milk produced 2 to 3 days postpartum. The milk then gradually changes from colostrum to mature milk.

According to the research team, a human adult may need to drink 1 litre of milk a day to achieve therapeutic effects on the aforementioned disease conditions. The mEVs are thus more beneficial for individuals with lactose intolerance.

Currently, the researchers are exploring the mechanisms underlying the treatment effects. The team is also working with doctors to explore clinical trials with patients in the near future.

## **About National University of Singapore (NUS)**

The National University of Singapore (NUS) is Singapore's flagship university, which offers a global approach to education, research and entrepreneurship, with a focus on Asian perspectives and expertise. We have 16 colleges, faculties and schools across three campuses in Singapore, with more than 40,000 students from 100 countries enriching our vibrant and diverse campus community. We have also established our NUS Overseas Colleges programme in more than 15 cities around the world.

Our multidisciplinary and real-world approach to education, research and entrepreneurship enables us to work closely with industry, governments and academia to address crucial and complex issues relevant to Asia and the world. Researchers in our faculties, research centres of excellence, corporate labs and more than 30 university-level research institutes focus on themes that include energy; environmental and urban sustainability; treatment and prevention of diseases; active ageing; advanced materials; risk management and resilience of financial systems; Asian studies; and Smart Nation capabilities such as artificial intelligence, data science, operations research and cybersecurity.

For more information on NUS, please visit [nus.edu.sg](https://nus.edu.sg).

## **About the NUS Yong Loo Lin School of Medicine (NUS Medicine)**

The NUS Yong Loo Lin School of Medicine is Singapore's first and largest medical school. Our enduring mission centres on nurturing highly competent, values-driven and inspired healthcare professionals to transform the practice of medicine and improve health around the world.

Through a dynamic and future-oriented five-year curriculum that is inter-disciplinary and inter-professional in nature, our students undergo a holistic learning experience that exposes them to multiple facets of healthcare and prepares them to become visionary leaders and compassionate doctors and nurses of tomorrow. Since the School's founding in 1905, more than 12,000 graduates have passed through our doors.

In our pursuit of health for all, our strategic research programmes focus on innovative, cutting-edge biomedical research with collaborators around the world to deliver high impact solutions to benefit human lives.

The School is the oldest institution of higher learning in the National University of Singapore and a founding institutional member of the National University Health System. It is one of the leading medical schools in Asia and ranks among the best in the world (Times Higher Education World University Rankings 2023 by subject and the Quacquarelli Symonds (QS) World University Rankings by subject 2022).
